ABSTRACT

An adhesive film for rubber adhesive tips in which an adhesive coat is on the back surface of rubber or lambskin fabric, this surface is used for better gripping and/or releasing in athletic sports. It is used to increase the overall performance by 5 to 15%, while playing athletic sports. It surpasses the discomfort and dexterity of athletic gloves, giving the hand the freedom to breath as well as natural feeling of throwing or gripping. Sweat and moisture are major factors in why many balls are thrown inaccurately. Many athletes have small hands and cannot get a good grip on athletic balls. Some examples are as follows:

- Gives pitchers better gripping and control of pitches, more accurate release points
- Gives a football player better grip and more accurate release points
- Gives a basketball player better grip and better, more accurate release points
